House of Numbers
a world without HIV/AIDS may be closer than you think

"House of Numbers" film maker Brent Leung interviews
Nobel Prize laureate, Dr. Luc Montagnier,
"co-discoverer of HIV."

Sub-Saharan Africa, the hardest hit region, is home to two-thirds (67%) of people living with HIV.

**FILM MAKER BRENT LEUNG:** Is treating oxidative stress one of the best ways to deal with the African AIDS epidemic?

**DOCTOR LUC MONTAGIER:** I think this is one way to approach,
I think this is one way to approach to decrease the rate of transmission because I believe HIV.
we can be exposed to HIV many times

without being chronically infected,
our immune system will get rid of the virus within a few weeks, if you have a good immune system;
and this is also the problem of African people.

Their nutrition is not very equilibrated, they are in oxidative stress, even if they are not infected with HIV.
so their immune system doesn’t work well already.

So it’s prone, it can, you know, allow HIV to get in and persist.
So there are many ways which are not the vaccine, the magic name, the vaccine,

many ways to decrease the transmission just by simple measures of nutrition,

giving antioxidants -- proper antioxidants -- hygiene measures, fighting the other infections.
So they are not spectacular, but they could, you know, decrease very well the epidemic,

to the level they are in occidental countries, western countries.
If you have a good immune system, then your body can naturally get rid of HIV?
Do you think we should have more of a push for antioxidants, and things of that nature in Africa than antiretrovirals (AIDS Drugs)?

We should push for more, you know, a combinations of measures; antioxidants, nutrition advice, nutrition,
fighting other infections -- malaria, tuberculosis, parasitosis, worms --

education of course, genital hygiene for women, and men also.
Very simple measures which not, not very expensive, but which could do a lot.

And this is my, actually my worry about the many spectacular action for the global funds.
to buy drugs and so on, and Bill Gates and so on, for the vaccine.

are not very well funded, they're not funded at all,

But you know those kind of measures

or they are, you know, it really depends on the local government to take choice of this,
but local government they take advice of the scientific advisors from the intelligent institutions, and they don't get this kind of advice very often.

Brent Leung: Well there's no money in nutrition, right?
Well there's no money in nutrition, right?

BRENT LEUNG:

There's no profit.

DR. MONTAGNIBR:

There's no profit, yes.
There's no profit, yes.

Water is important.

Water is important. Water is key.
Now one thing you said, you were talking about the fact that if you have a built immune system, it is possible to get rid of HIV.
If you take a poor African who's been infected and you build up their immune system, is it possible for them to also naturally get rid of it?
BRENT LEUNG: Is it possible for them to also naturally get rid of it?

DR. MONTAGNIER: I would think so.

BRENT LEUNG: That's an important, that's an important point.
That's an important point.

It's important knowledge which is currently neglected.
People always think of drugs, and vaccine.

So this is a message which may be different from what you heard before, no?
So this is a message which may be different from what you heard before, no?
No, no, yes, my message, it's different from what you heard from (Anthony) Fauci or –

Yes, it's a little different.
